DIESEL PARTICULATE FILTER

Regeneration procedure

If **DPF FULL, SEE HANDBOOK** appears in the message centre, carry out the following procedure.

Note: *At all times during this procedure you should observe all relevant speed limits, laws, and regulations. Always take account of traffic and weather conditions, and drive with consideration for other road users.*

1. Drive the vehicle until the engine reaches normal operating temperature. The engine should not be left idling to achieve working temperature.
2. Drive the vehicle for a further twenty minutes, keeping the speed above 48 km/h (30 mph) and the engine speed between 2500 and 4000 rpm.

   Note: *Keeping the engine speed within this range may require the use of CommandShift.*
3. If regeneration is successful the warning message will disappear. If the message remains repeat the process.

Note: *When driving off-road during the regeneration process, greater accelerator pedal use may be required.*

Note: *If the warning message remains after following the regeneration process three times, contact your Dealer/Authorised Repairer for assistance.*
