DUAL VIEW TOUCH SCREEN

Dual view touch screen option is a development of the LCD screen that enables the driver and front seat passenger to view two separate display modes.

Legal restrictions may not allow the driver to view moving images, as provided by TV and video formats, while the vehicle is in motion.

HOW DUAL VIEW WORKS

Viewing angles for driver and front seat passenger are such that neither can view the full display that the other is viewing. However, there is an optimum viewing angle of 30 degrees where no cross over of images can be perceived. From this point, the closer to screen centre or screen side edges that the viewer moves to, the more likely cross over of images is. During normal use of dual view, image cross over is unlikely.

Rear seat passengers may be able to see both views when dual view is active.

DUAL VIEW SELECTION

When the ignition is switched on or the audio unit is turned on after being turned off, single view mode will be the default view.

To select dual view, press the dual view hard key on the fascia surround. See **112, TOUCH SCREEN AUDIO/VIDEO CONTROLS**.

Press again to display the dual view **Options** menu. From here, a change can be made to the viewing source or dual view can be cancelled.

If TV or a video format source were being viewed previously, the same source will be displayed.
