

Note: As the TV system is continually checking the availability of channels, it is possible for a channel to be in the list, but not actually available (e.g., when driving through different transmitter regions).

Note: After a country format change, the channel list will be empty until the system has scanned all of the channels at least once.

7. TV channel presets:

- Touch and hold to store the current channel as a preset. The channel name will then be displayed on the soft key.
- Briefly touch to select the channel stored on that preset.

Note: Stored presets contain information identifying the country where the preset was stored. When a preset is selected, the TV format of the country where the preset was stored will be adopted. As analogue TV formats differ in different countries, this may create a situation where the analogue channel list is empty.

For information on the use of the audio/video controls on the audio unit and steering wheel, see **157, AUDIO/VIDEO CONTROLS**.

WWTV China - AVS non-standard coding format

AVS is a video/audio coding format, created in China for the Chinese market only. It is similar to MPEG4 in its performance. The Melco TV tuner is capable of decoding AVS coded broadcasts, providing a standard implementation of the codec has been followed. During field testing, it became apparent that at least one broadcaster had implemented a non-standard AVS format which resulted in a blank screen.

Jaguar Land Rover accept no liability for the inability to decode and display video/audio content from any non-standard transmissions.
