## URBAN CYCLE

The urban test cycle is carried out from a cold start and consists of a series of accelerations, decelerations and periods of steady speed driving and engine idling. The maximum speed attained during the test is $50 \mathrm{~km} / \mathrm{h}(30 \mathrm{mph})$ with an average speed of $19 \mathrm{~km} / \mathrm{h}(12 \mathrm{mph})$.

## EXTRA-URBAN CYCLE

The extra-urban test cycle is carried out immediately after the urban test. Approximately half of the test comprises steady speed driving, while the remainder consists of a series of accelerations, decelerations and engine idling. The maximum test speed is $120 \mathrm{~km} / \mathrm{h}(75 \mathrm{mph})$ and the average speed $63 \mathrm{~km} / \mathrm{h}(39 \mathrm{mph})$. The test is carried out over a distance of 7 km (4.3 miles).

## COMBINED

The combined figure is an average of the urban and extra-urban test cycle results, which has been weighted to take account of the different distances covered during the two tests.
