Rear Wiper

The frequency of the rear wiper, when set to intermittent, increases with the vehicle's speed.

This feature can be enabled/ disabled by your Retailer/ Authorised Repairer.

WINTER PARK POSITION

To prevent damage to the bonnet, make sure that the wiper arms are in the Winter park position before lifting the wiper blades away from the windscreen.

To avoid damage to the bonnet, do not lift the wiper blades, when they are in the normal park position.

When the vehicle is parked, the wipers can be set to park in a higher position than normal. This allows the wiper blades to be lifted from the windscreen to limit the effects of freezing to the glass and to allow the removal of snow, mud and leaves, etc. The wiper Winter park position can be enabled/disabled in the Instrument panel menu. See **53, INSTRUMENT PANEL MENU**.

Do not drive with the wipers in the Winter park position. The wipers should be returned to the normal park position before driving the vehicle.

HEADLAMP WASHERS

If the headlamps are on and there is sufficient liquid in the washer reservoir, operating the screen wash also power washes the headlamps.

The headlamp power wash operates on every fifth operation of the screen washer, provided the headlamps are still switched on and approximately 10 minutes have elapsed since the last headlamp wash.

Switching the headlamps or ignition off and back on again, resets the cycle.

Note: *The headlamp washers are inhibited when the washer fluid reservoir level is low.*
